## ABSTRACT

China's imports of farm products rose abruptly in 1961, reached a peak of \$682 million in 1964, and declined thereafter to \$524 million in 1969, or one-third of the value of all China's imports. A dozen countries supply the bulk of China's agricultural imports, principally wheat, rubber, sugar, and cotton. Foremost among suppliers are Australia, Canada, Malaysia, Singapore, Ceylon, and Cuba.

Farm products worth some \$800 million made up nearly half of China's total exports in 1969. Rice, soybeans, numerous fruits and vegetables, and tea, as well as live animals and various livestock products, are important foreign exchange earners. Twelve countries account for most of China's agricultural exports, but only in four does China have a significant share of the market. Beginning in 1961, the USSR and Eastern Europe were no longer large markets for China. U.S. agricultural exports to China before the suspension of trade in 1950 consisted mainly of cotton and tobacco. U.S. imports included tung oil, silk, hog bristles, and goat and kid skins.

Keywords: China, <sup>v</sup>agricultural trade, agricultural products, statistical data, agricultural exports, agricultural imports.

Note: In tables, n.a. means not applicable, ... means not available, and a dash means none or negligible. All tons in the report are metric.

## SUMMARY

The People's Republic of China ranked 19th among world importers of agricultural products in 1969. The value of China's agricultural imports was \$524 million, less than one-tenth of that for either West Germany or the United Kingdom, the two leading agricultural importers.

Wheat accounted for two-fifths of China's agricultural imports in 1969, rubber for another fifth. Sugar and cotton are substantial import items. Of lesser importance are wool, jute, coconut oil, and dates. Tobacco was imported before World War II, mostly from the United States, but none has been reported in recent years. China buys from many sources, but most of its imports come from a dozen countries. Foremost among them are Australia, Canada, Malaysia, Singapore, Ceylon, and Cuba.

Agricultural products, nearly two-thirds of China's total exports in 1935-39, accounted for almost half of the total during the late 1960's, when China was among the top 10 to 14 exporters of farm products. Rice is the leading agricultural export. More than a million tons move out in some years, whereas several times during the 1930's, more than a million tons were imported. Live cattle and hogs are shipped in large numbers to Hong Kong. Meat and preparations, tobacco, pulses, and many fruits and vegetables are among China's exports. Soybeans, tea, silk, eggs, and hog bristles are traditional products, important today as in years past. For several export items, China is a leading world supplier, accounting for 10 percent or more of the world trade in 1969.

Twelve countries take the bulk of China's agricultural exports. Hong Kong and Japan are the largest markets. Malaysia, Singapore, and Ceylon are also substantial outlets within the Far East region. West Germany, France, Italy, and the United Kingdom are the major outlets in Western Europe. While these countries are important as markets for China, only Hong Kong, Ceylon, Malaysia, and Singapore count China as a significant supplier of farm products. In the 1950's, the bulk of China's agricultural exports went to the USSR and Eastern Europe. This trade declined sharply after 1960, particularly with the USSR.

Before U.S. trade with China was suspended in 1950, shipments of U.S. farm products to China accounted for 2 to 4 percent of all U.S. agricultural exports and for 15 percent of China's agricultural imports. China ranked eighth to 11th among leading U.S. destinations. Cotton and tobacco were the main products; wheat and flour were important in some years; a number of fruits and vegetables were of lesser importance.

U.S. imports of farm products from China accounted for 2 to 4 percent of all our agricultural imports and for one-fourth of China's agricultural exports. Tung oil, silk, hog bristles, and goat and kid skins were the principal items of trade. For many products, China supplied one-fifth of U.S. imports; for some, China's share was more than three-fourths.

## INTRODUCTION

### Purpose of Study

The purpose of the study was to develop a statistical picture of trade in agricultural products by the People's Republic of China over the past two decades. A resumption of trade between the United States and the People's Republic of China may become possible. To obtain some idea of prospects of trade between the two countries, this study examines the extent of China's trade with the world for the past 20 years, looking at the composition and direction as well as the magnitude of trade. To provide some perspective for this review it also looks at trade patterns for a number of years prior to World War II.

Serious limitations in the data, discussed below, made it impossible to begin all series at 1950. Some data are available for 1970 and a few returns are coming in for 1971. But since the objective here was to present a historical survey against which subsequent reviews of current developments might stand, it was decided to close the series at 1969, the latest year for which nearly complete coverage is possible for the commodities and countries included in the study.

The narrative that accompanies the statistical tables does not attempt a complete analysis and summary. It gives, instead, certain highlights that are intended to serve as an invitation to study the statistical materials.

### Data Sources and Compiling Procedures

The usual procedures for compiling trade data of a country could not be employed because China did not publish customs returns during the period studied. The alternative was to measure China's trade in terms of the exports and imports reported by its trading partners. By this means, it has been possible to describe the development of China's trade in farm products. Despite data problems that were often exasperating, sometimes insoluble, and occasionally serious enough to impair detail, the broad outlines of trade patterns remain coherent.

The method used is not fully satisfactory. It is extremely laborious, requiring reference to the customs returns of each country to determine, for each agricultural product, whether trade occurred with China. A problem arises in measuring the value of trade because what is shown as China's exports is in fact the sum of imports from China of all its trading partners valued c.i.f. in nearly all instances. Thus, China's exports are overvalued since conventionally they would be measured f.o.b. China ports. By the same token, China's imports are undervalued.

A further difficulty is that in terms of quantity as well as value, the exports reported by country A as destined for country B seldom agree with (and often vary sharply from) imports reported by B as having come from A. This problem arises from lags in shipping, transshipments or diversions, and other reasons often unknown and unexplainable. Such discrepancies would doubtless appear if Chinese customs returns were available for comparison. Again, there is no alternative in measuring the trade of nonreporting countries.

China's trade as measured by reports of its trading partners obviously is understated since it does not include exports to or imports from countries that do not publish trade reports. Thus, China's trade with other communist countries of Asia, with East Germany and Romania, and with countries of the Arabian Peninsula is not included in this study. There is no way to estimate the magnitude of this trade.

Time limitations prevented compiling in an orderly fashion the agricultural trade statistics for 80 or more countries for each year in the past two decades. Fortunately, others have done much of this needed work. Over the years, two organizations have compiled data regarding the trade of China and other nonreporting countries of the world. The Bureau of International Commerce (BIC) in the U.S. Department of Commerce has compiled trade of individual Free World countries with individual communist countries year by year. BIC reports show trade of a given country with China in all commodities and commodity groups, and in certain commodity items. The presentation conforms to the Standard International Trade Classification (SITC).

BIC reports were useful in measuring the value of trade in agricultural products. The presentation in those reports did not permit compilation of data according to the definition usually employed by the Foreign Demand and Competition Division of ERS to measure trade of foreign countries in agricultural products. For this study, agricultural products were taken to include (1) food (except fish), beverages, and tobacco, (2) crude animal and vegetable materials (except wood and pulp), and (3) oils and fats. Thus it was possible to develop data for individual Free World countries showing the value of exports to China of all commodities and of agricultural commodities for more than 15 years. Similar series were prepared for imports.

The BIC reports for each year have been summarized in the annual Battle Act Reports made by the Department of State to the Congress on the operations under the Mutual Defense Assistance Control Act of 1951. The values of agricultural exports to and imports from China by all Free World countries combined were developed for the present report from these summary materials, using the same definition as for individual countries. The series for total agricultural

trade with China are not fully comparable with the data for individual countries because certain revisions in the latter were incorporated in the summary materials.

Trade of the USSR and countries of Eastern Europe with China are not shown in the BIC reports. Data for the USSR's trade with China since 1950 (total and agricultural, exports and imports, quantity and value) were compiled from the official Foreign Trade Returns of the USSR. Trade data for Eastern Europe are not readily available and the extent of agricultural trade with China could only be approximated.

Quantities of selected agricultural products exported to or imported from China by East European countries are reported by the Food and Agricultural Organization of the United Nations (FAO). Applying estimated unit values to these quantities, it was possible to approximate the level of agricultural trade of each country with China.

The above components were consolidated in table 1 to derive overall measures of the total and agricultural trade of China since 1953. The same components appear in tables 9 and 10, which show China's agricultural trade by principal countries of origin and destination.

BIC reports were not suitable for compiling time series of data in quantity terms for China's trade in agricultural commodities. While these reports showed some commodities separately, the presentation was predominantly in terms of commodity groups. Quantity totals could be given for certain groups, but the magnitudes of component items were concealed in the totals. For other groups, quantity totals were not appropriate, and only value totals were given.

Tables showing quantities of trade since 1950 were compiled mainly from FAO sources. Most of the data in tables 11 and 12, both quantity and value, are taken from FAO Trade Yearbooks.

These yearbooks were useful for the present study because they show trade in much greater commodity detail than the BIC reports. Unfortunately they do not include all agricultural products. Among those lacking are processed fruits and vegetables (part of SITC 05), most miscellaneous food stuffs (09), hides and skins (21), cotton linters and waste (263.2-.4), wool tops, shoddy, and waste (262.3-.9), and crude materials (29).

Another difficulty with the FAO source relates to the matter of valuation. There is no indication of how the value series are derived for commodities traded by China and other nonreporting countries. But where it was possible to make comparisons, it was found frequently that the FAO value series were not consistent with those of BIC. The FAO value series are given here in tables 11 and 12 to show the relative importance of the various commodities traded by China. The BIC value series, though not comparable, are given in tables 9 and 10 to show the relative importance of the countries that trade with China and to determine the share of agricultural products in total exports and in total imports.

Tables 23 through 32 and 42 through 66, showing commodities traded by origin or destination, were developed with some modification from data given in annual supplements to the FAO Trade Yearbooks. These supplements present data compiled from trading partners of nonreporting countries (not including, of course,

trading partners that are themselves nonreporting). They show trade in quantity terms only. The figure for China's total export of any commodity is the sum of the quantities reported as imported by China's trading partners. The commodity totals shown in these tables are usually, but not always, consistent with those in the Trade Yearbooks.

Tables 33 through 41 and 67 through 87 show agricultural trade of selected countries with China in both value and quantity terms. Both value and quantity data for the USSR were taken from the official returns of that country. For other countries, the quantity series were compiled from the annual supplements to the FAO Trade Yearbooks. The value series for Free World countries were compiled from BIC reports while those for countries of Eastern Europe were derived as explained on page 3.

Tables 2,3,4,6, and 7, showing China's trade during 1935-39, were compiled from the 1937 and 1940 issues of the Trade of China, published in Shanghai. The classification of commodities follows two separate schemes--one for exports and one for imports. Each is peculiarly Chinese and bears no relationship to the Standard International Trade Classification employed by many countries today. To measure total exports and imports of all farm products, special effort was taken to identify all items and regroup them according to today's conventional SITC categories as shown in table 2.

To show China's trade in the 1930's and earlier periods, tables 5 and 8 were compiled from data published in various issues of the International Yearbook of Agricultural Statistics by the International Institute of Agriculture. This effort succeeded only in part. For one thing, data for several commodities were not published in the earlier periods. Also, some products were not shown at all; for example, no table was published on trade in tung oil, a product characteristically Chinese at that time and of major importance among China's exports. Since the Institute's yearbooks showed trade in quantity only, it was not possible to determine the relative importance of different commodities.

There are further problems arising from changes in China's boundaries during these earlier years. Most notable was the question of Manchuria, and adjustments were made in preparing tables 5 and 8 to show China's trade both including and excluding Manchuria.

It should be noted that what is shown as China's trade in tables 2 through 8 is actually the reported seaborne trade only.

#### REVIEW OF CHINA'S TRADE

China's total merchandise trade has fluctuated somewhat and trended slightly upward since the mid-1950's. The upper portion of figure 1 shows approximate values of exports and imports since that time; the general range is between \$1.5 billion and \$2.0 billion each (see also table 1). They are approximate in that they do not represent China's recorded trade. The level of imports shown here is the sum of exports to China from its trading partners at f.o.b. values. Similarly, the export level reflects imports of trading partners from China,

nearly all valued c.i.f. For a conventional comparison of trade, the import level in the chart should be adjusted upward and the export level adjusted downward to make allowance for costs of insurance and freight. Adjusting each by 10 percent reverses the balance shown in the chart and suggests an excess of imports in all years except 1962-64. While an adjustment of 10 percent is arbitrary, the resulting relationship of exports and imports is probably more realistic.

The six smaller charts at the bottom of the page might well be similarly adjusted. This is especially true of the two charts on the right hand side of the page which compare exports with imports. For the remaining four charts, this adjustment is not necessary since it would not change the relationships between the pairs of lines shown. Prominently indicated here is that trade with the Free World has grown and now accounts for most of China's exports and imports. Agricultural exports fell during the early 1960's but are now at the pre-1960 level. Agricultural imports rose sharply in 1961, and they have continued at the higher levels since then--more than double their values during the 1950's.

China's position among some of the leading world traders, in the last 15 years is indicated in figure 2. Every European country except Ireland and Portugal registered larger imports than China in 1969. Other countries that exceeded China include Canada, Argentina, Brazil, Mexico, Venezuela, Hong Kong, India, Japan, the Republic of Korea, and Singapore. All countries of the Middle East and Africa (except South Africa) ranked below China. If a direct comparison of trade is unfavorable to China, the more meaningful comparison of imports per capita ranks China even lower (fig. 3). One should have no illusions about prospects for exports to China. Despite its size and despite (perhaps because of) its large population, China is not a major trading nation. It is not likely to become one until per capita incomes rise substantially, a development that will require tremendous capital investments and long span of time.

#### China's Agricultural Trade, 1935-39

The pattern of China's agricultural trade during the late 1930's (a period when the United States was trading with China, but before the disruptions during and after World War II, and yet not free of regional and internal dislocations) is shown in table 2. At that time, China's world trade in all commodities showed an excess of imports over exports. Agricultural exports were much larger than imports, however. Nearly one-third of the imports were agricultural products consisting largely of cereals, fibers, sugar, and tobacco. Nearly two-thirds of China's exports were agricultural, and they included a wide range of commodities. The United States accounted for large shares of China's trade in farm products--15 percent of the imports and one-fourth of the exports. But China's trade with the United States tended to be concentrated in a relatively few items. The United States supplied nearly 90 percent of China's tobacco imports (table 3). Five items--wheat flour, oranges, tobacco, cotton, and resin--accounted for 85 percent of China's agricultural imports from the United States, but only 35 percent of all imports of farm products. And for these five items combined, the U.S. share of the Chinese market was 37 percent.

Similarly, China's export tradewith the United States in the late thirties tended to focus on a relatively few commodities. The 56 items shown in table 6 accounted for 92 percent of China's agricultural exports. Twelve of these items 1/ represented 80 percent of China's agricultural exports to the United States in the late thirties, but only 40 percent of all exports of farm products. The 12 items include all those for which the U.S. share was 35 percent or more. (For eight of the 12 items the U.S. share was 50 percent or more of each).

While the United States was almost the sole supplier of tobacco to China during 1935-39, it ranked second after India as a supplier of cotton (table 4). It ranked second also as a source of wheat and wheat flour; Australia was the leading supplier.

China imported substantial quantities of wheat, rice, flour, sugar, tobacco, and cotton before World War II and of rice, flour, and cotton even before World War I (table 5). In some years during the 1930's, China was second only to the United Kingdom as an importer of flour. Imports of rice exceeded a million tons several times in the same decade, and only in a few years was China out-ranked by any country other than Japan.

Much of China's agricultural exports during 1935-39 found nearby markets in Hong Kong, Korea (Chosen), and Japan (table 7). Great Britain was the principal buyer of certain products, including eggs, pulses, tea, bristles and tung oil. Germany, France, and the Netherlands were important markets for certain commodities.

China was a traditional supplier of a number of farm products entering world trade before World War II. It was a leading world exporter of eggs, soybeans, soybean oil, sesameseed, peanut oil, live hogs, and silk (table 8).

#### China's Agricultural Trade, 1950-69

China ranked 19th among world importers of farm products in 1969 with a level of \$524 million, or less than 10 percent of either of the two leading importers--West Germany and the United Kingdom (fig. 4). Australia and Canada are China's leading suppliers--usually at more than \$100 million each--and their shipments are almost exclusively wheat (table 9). Wheat has been China's principal agricultural import since 1960 (table 11). Imports totaled 6.4 million tons in 1966, but fell to half that in 1969, when they were valued at more than \$200 million. China was the fifth largest importer of wheat in 1969, accounting for 7 percent of the world total (table 15). In 1961, 1962, and 1964, China imported more than a million tons annually of other grains and flour.

Malaysia and Singapore together stood third among China's agricultural suppliers in 1969 with exports, largely rubber, valued at \$102 million. Rubber is second in value of China's agricultural imports. Indonesia and Ceylon are other suppliers of rubber to China. Quantities imported from all sources

---

1/ Walnuts, skins of goat, kid, lamb, and sheep, kolinsky furs, marmot, weasel, sesame, silk, wool, bristles, cottonseed oil, peanut oil, and tung oil.

increased through the 1960's, reaching 278,000 tons in 1969, when China took 8 percent of total world imports.

Cotton and sugar are substantial import items, but neither is near wheat or rubber. Pakistan's 1969 exports to China of \$26 million were equally divided between cotton and jute. Imports from Egypt, Sudan, Syria, and Tanzania--mainly cotton--ranged from \$10 to \$20 million in that year. Cotton imports declined after the mid-1960's, and only 83,000 tons entered in 1969. Cuba is the principal sugar supplier; imports were estimated at \$60 million in 1969. Wool, jute, coconut oil, and dates are lesser items, with imports of each valued at less than \$10 million in 1969. China is not a significant importer of wool, but for the other three products, the country was among the six largest importers in 1969.

Twelve countries accounted for virtually all of China's agricultural imports in 1969 (table 13). China is an important outlet for each of them except France and Egypt. Three of the countries--Australia, Malaysia, and Tanzania--found markets in China for 6 percent of their agricultural exports in 1969. The Chinese share of agricultural exports was 10 percent from Pakistan and 13 percent from Ceylon. Six of the 12 countries exported more farm products to China than to the United States, but admittedly, these were not major agricultural exporters. For the entire group of 12 exporters, their agricultural exports to the United States were more than double those to China.

China is a major exporter of agricultural products, ranking among the top 10 to 14 exporting countries in the last half of the 1960's (table 17). Exports, valued at more than \$800 million in recent years, are more varied than imports. Rice heads the list; exports often exceed 1 million tons, and China ranks in third or fourth place among major world suppliers (table 12).

China exports large quantities of fresh meat, mainly to Hong Kong. Live cattle and hogs, sent to the same market, are also significant foreign exchange earners. Other livestock products important among China's exports include silk, meat preparations, eggs, and wool. Not to be forgotten are hog bristles, another traditional product.

Soybeans, tea, tobacco, and pulses are other major exports. No less important is a long list of fruits and vegetables, both fresh and processed.

Many agricultural products important in China's export trade are products in which China is important among world exporters. For half of the 22 items shown in table 16, China ranks among the five largest suppliers and at the same time accounts for at least 5 percent of total world exports of each. For eight of these 11 items (rice, live hogs, silk, eggs in the shell, eggs not in shell, tung oil, honey, and castor beans) China accounted for 10 percent or more of world exports in 1969.

Twelve countries took 90 percent of China's agricultural exports in 1969 (table 14 and fig. 5). Nearby Hong Kong and Japan were the major markets. China was an important supplier of farm products to Malaysia and Singapore and held even larger shares of the markets in Hong Kong and Ceylon. In Japan, the Chinese share was a modest 4 percent. The remaining seven countries, though important to China, could not count China as a significant supplier. Four of

the 12 countries (Hong Kong, Malaysia, Singapore, and Ceylon) imported more farm products from China than from the United States. But for the 12 together, imports from the United States were more than 4 times those from China.

In the 1950's, the bulk of China's agricultural exports went to the USSR and Eastern Europe (table 10). China was then a principal supplier of Russian agricultural imports. After 1960, this trade, particularly with the USSR, declined sharply.

### U.S. Agricultural Trade with China: Historical and Prospective

American trade with China began in the years before the United States became independent. It never reached the proportions of U.S. trade with industrial nations. In the past 150 years, U.S. exports of all products to China seldom exceeded 2 percent of all U.S. exports, and in most of these years the share was less than 1 percent. On the other hand, the share going to the leading U.S. market was never less than 14 percent, and in 96 of the 150 years it was over 30 percent. Meanwhile, the number 2 U.S. market never took as little as 4 percent of all U.S. exports, and in 123 years the share ranged from 8 to 20 percent.

The Chinese market for U.S. agricultural products was equally modest. For 15 years prior to the 1950 embargo on trade with China, some 2 to 4 percent of U.S. agricultural exports went to that country. After World War II, China's share rose temporarily to 6 percent as the United States extended massive food aid. But since 1950, the share of U.S. agricultural exports going to the Far East has gained steadily despite the cessation of trade with China (fig. 6).

A judgment as to the past importance of China for U.S. agricultural exports depends upon the viewpoint of the observer and the comparisons that he makes. In terms of averages for several 5-year periods during 1910-50, China ranked high as a market for U.S. farm products (table 18). Except for the years of World War II, it ranged from eighth largest to 11th largest, and through most of the period China accounted for 2 to 4 percent of U.S. agricultural exports. Thus, in an array of 80 or 100 countries, China ranked near the top, and among this number of countries a share of 2 to 4 percent is well above average. Of the 18 countries shown to rank above China in at least one of the 5-year periods, only four consistently outranked China in each of the six periods (Canada, Italy, Japan, and the United Kingdom).

On the other hand, during 1927-31 when China ranked most favorably (in eighth position and taking 4 percent of all U.S. agricultural exports), exports to the leading destination were more than six times those to China. The average level of U.S. agricultural exports to the other six countries that exceeded China was nearly double the level going to China. Thus, while China, in eighth position, outranked a long list of countries, it was not at all close to first position in value terms.

Cotton and tobacco were the leading items sold to China from American farms before World War II (table 20). Shipments of wheat and wheat flour varied sharply; they were negligible in some years and as much as 15 percent of the

total value in others. Lesser products included oranges, raisins, and a variety of other fruits and vegetables.

Cotton exports to China reached nearly 500,000 bales per year in the early 1930's, and 6 percent of U.S. exports went to that market. China accounted for one-fifth of U.S. tobacco exports in the late 1920's and early 1930's and took a tenth of U.S. wheat and flour exports in the early 1930's (table 21).

China ranked among the top 12 suppliers of farm products to the United States both before and after World War II, and accounted for 2 to 4 percent of all U.S. agricultural imports (table 19). Seven countries (Argentina, Brazil, Canada, Colombia, Cuba, Malaya, and the Philippines) consistently exceeded China in the three 5-year periods prior to 1950.

Tung oil, raw silk, hog bristles, and goat and kid skins were the principal items imported from China (table 22). Carpet wool, cotton, sesameseed, peanut oil, feathers, and sausage casings were important in some years. Items of lesser value, persistent among imports from China, included shelled walnuts, tea, eggs not in the shell, and cassia and cassia vera. The importance of China as a supplier to the United States during the 1930's is not fully indicated by the Chinese share of all U.S. agricultural imports. Many of the items imported from China were specialty products. China supplied more than three-fourths of U.S. imports of tung oil, bristles, eggs not in shell, sesameseed, and weasel skins. For many of the remaining items, China supplied more than one-fifth of U.S. imports.

If the United States were to supply 15 percent of China's agricultural imports as it did in the late 1930's, this would mean annual sales of \$75 million. On the other hand, if China might come to rank in eighth to 11th place as a destination for U.S. farm products, as it did for many years before World War II, sales would be much higher; for the 5 years 1967-71, U.S. sales to the country in 11th place averaged \$154 million and to the country in eighth position, \$208 million. Finally, if the United States could move 2 to 4 percent of its agricultural exports to China as it did before World War II, they would range from \$130 million to \$270 million (total U.S. agricultural exports averaged \$6.7 billion over the last 5 years). The above may suggest a range of possibilities for market development in China. However, sales of \$200 million to China appear unrealistic when we consider that this would be 40 percent of China's present \$500 million market for agricultural imports. Actual prospects will depend heavily on what political accommodations are made between the two countries. Sales may grow with passing time, but increases will likely depend upon overall growth of China's agricultural imports.
